Research Question(s) A good research question is precise, focused on a specific problem, and is researchable within the given scope. But it is also complex enough to require the entire paper and scientific enough to require a scientific approach. It is formulated in one sentence, cannot be answered yes/no, and allows for sub-questions.	Problem A practical problem does not necessarily have to be relevant from a scientific point of view. So why is the chosen problem a problem that needs scientific methods?	Data Can data (e.g. from the company) be accessed to answer the research question (if required)? Which data are available, which would be needed?	Outline How should the work be structured? Which chapter structure is suitable for preparation?
	Relevance Why is the topic relevant from practice and theory?	Method Which method (if required) should be used for the research? Why exactly this method? Are there alternatives? What could be the result (a priori assumption)?	
Literature base On the first canvas foundation, strategic immersion in the scientific literature begins early on. This further outlines the topic while establishing depth. Important literature sources should be listed here.
